

1. Main Progress in this Sprint

- We cleaned the data from different sources (Google Places API, Yelp API,...)
- We gathered data from government license dataset
- We exploited the data from SafeGraph for future use

2. Plans for the Next Step:

- Integrate data from all sources into one useful dataset
- Start to generate visualizations and come up with conclusions with respect to the questions asked in the beginning of project

More details about next step: we are trying to analyze the reviews of restaurants in different months (like in the beginning, in the middle and the most recent time of Covid-19), compared with corresponding reviews to see the trend of it.

Also, we would like to see if it's possible to analyze the reviews change by the geographical difference (such as by zip code or by different cities in Massachusetts area).

Furthermore, we want to come up with some conclusions about whether bigger brands (like KFC, Starbucks or Subways) actually makes a difference during Covid time, and how Government assistance policies helped the restaurants to survive meanwhile.
